DETAILED ACTION

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-8, 10-12, and 16-25 are rejected under 35 U.S.C. 103(a) as being unpatentable over *Verkler et al.* (US patent 5,850,517) in view of *Eggleston et al.* (5,958,006).

As per claims 1, 7, 10, 16, and 24-25, *Verkler et al.* further disclose a method and apparatus for transmitting information from a server to a client station in a mobile-based client-server system, comprising the steps of:

- evaluating a received message to determine whether the server has a selected type and quantity of information waiting for the client station, the received message being prepared by the server without the client station first initiating a connection with the server (col. 4/ln. 1-38, col. 6/ln. 64-col. 7/ln.9, col. 9/ln. 24-col. 10/ln. 13);
- generating a signal containing a telephonic address of a communication transceiver associated with the server and instructions for establishing a log-on connection with the server

.

Application/Control Number: 08891301 Page 3

Art Unit: 2684

if the server has a selected type and quantity of information waiting for the client station (col. 4/ln. 1-26, col. 8/ln. 7-16, 59-62, col. 9/ln. 1-22, and col. 10/ln. 24-29); and

- transmitting the signal to a transceiver associated with the client station, the client station transceiver configured to establish a communication link with the server transceiver based on the telephonic address (col. 4/ln. 1-26, col. 8/ln. 7-16, 59-62, col. 9/ln. 1-22, and col. 10/ln. 24-29).

Verkler et al. disclose Applicant's invention except teaching evaluating the message at the server to determine the message is of a selected quantity of information. Eggleston et al. disclose evaluating the message at the server to determine the message is of a selected quantity of information (abstract, fig. 3-10, col. 7/ln 57-col. 8/ln. 55, col. 9/ln. 60-col. 10/ln.32). In order to optimize the types and quantity of information being transferred, it would have obvious to one of ordinary skill in the art at the time of Applicant's invention to provide a method for communicating summarized data as taught by Eggleston et al. in conjunction with a communication link for client-server as taught by Verkler et al.

Verkler et al. discloses Applicant's invention except teaching transceiver associated with the server and client station. However, it is inherent that both the server and client station comprises transceivers in order to provide wireless communication path. It is inherent to one of ordinary skill in the art at the time of Applicant's invention to incorporate transceivers, inherently to provide mobile link, in conjunction with a communication link for client-server system as taught by Verkler et al..

Application/Control Number: 08891301

Art Unit: 2684

As per claim 2, Verkler et al. further disclose establishing a connection between the client station and the server in response to a received message (col. 5/ln. 31-39)

As per claim 3, *Verkler et al.* further disclose wherein the connection between the client station and server in established via the respective client station and the server transceivers (fig. 2, col. 3/ln. 56-67, col. 5/ln. 6-col. 6/ln. 15, col. 9/ln. 1-22, and col. 10/ln. 24-29).

As per claims 4-6, 11-12, and 20, Verkler et al. further disclose comprising the further steps of:

- evaluating a received message at the client station to determine whether the information is of a selected type (col. 4/ln. 12-38, col. 6/ln. 66-col. 7/ln. 2, col. 9/ln. 24-col. 10/ln. 13); and
- establishing a connection between the client station and <u>the</u> server in response to a received message if the information is of a selected type (col. 4/ln. 12-38, col. 6/ln. 66-col. 7/ln. 2, col. 9/ln. 24-col. 10/ln. 13).

As per claim 8 and 21, *Verkler et al.* disclosed Applicant's invention except for teaching wherein the server transceiver sends the message to the client station transceiver in the form of an SMS paging message. It would have been useful to provide an SMS paging message to provide automatic answer transmission. However, such is notoriously well-known in the art the Examiner takes official notice of such. Therefore, it would have ben obvious to one of ordinary skill in the art at the time of Applicant's invention to utilize the method of SMS paging message, well-known in the art, in conjunction with a communication link for client-server system as taught by *Verkler et al.*.

Application/Control Number: 08891301

Art Unit: 2684

As per claim 17, Verkler et al. further disclose the stored program causing the client station to perform the additional steps of:

- transmitting a first request for the information to the server via the established communication link (fig. 3, col. 4/ln. 12-55, col. 6/ln. 50-col. 7/ln. 48);
- receiving the requested information (fig. 3, col. 4/ln. 12-55, col. 6/ln. 50-col. 7/ln. 48); and
- transmitting additional information to the server via the established communication link (fig. 3, col. 4/ln. 12-55, col. 6/ln. 50-col. 7/ln. 48).

As per claim 18, Verkler et al. further disclose wherein the additional information comprises a further data request (fig. 3, col. 4/ln. 12-55, col. 6/ln. 50-col. 7/ln. 48).

As per claim 19, *Verkler et al.* further disclose a mobile-based client-server system, comprising:

- a client station adapted for communication with an associated client station transceiver (col. 4/ln. 12-55); and
- a server configured to periodically receive or generate information to be delivered to the client station, the server linked to an associated server transceiver (col. 4/ln. 12-55), wherein
- the server is further configured to transmit a message to the client station via the respective server and client station transceivers upon receiving or generating a selected type of information to be delivered to the client station without the client station first initiating a connection with the server (col. 4/ln. 1-38, col. 6/ln. 64-col. 7/ln.9, col. 9/ln. 24-col. 10/ln. 13);

Application/Control Number: 08891301 Page 6

Art Unit: 2684

Verkler et al. disclose Applicant's invention except teaching evaluating the message at the server to determine the message is of a selected quantity of information. Eggleston et al. disclose evaluating the message at the server to determine the message is of a selected quantity of information (abstract, fig. 3-10, col. 7/ln 57-col. 8/ln. 55, col. 9/ln. 60-col. 10/ln.32). In order to optimize the types and quantity of information being transferred, it would have obvious to one of ordinary skill in the art at the time of Applicant's invention to provide a method for communicating summarized data as taught by Eggleston et al. in conjunction with a communication link for client-server as taught by Verkler et al.

As per claims 22-23, *Verkler et al.* further disclose whether the information is of a type requiring that the client station be notified (fig. 3, col. 4/ln. 12-55, col. 6/ln. 50-col. 7/ln. 48, col. 9/ln. 60-col. 10/ln.32).

Conclusion

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Tett (5,635,918), Harrison et al. (5,796,727), Vazana (5,850,519), Eggleston et al. (5,958,006), Dillon (6,067,561), Smith (5,835,724), Doviak et al. (5,717,737), Hidary (5,852,775), Davis (5,392,452), and Gilchrist et al. (5,745,695) discloses method and apparatus for controlling message delivery to wireless system.
